

What is an API

EXPLAINED!

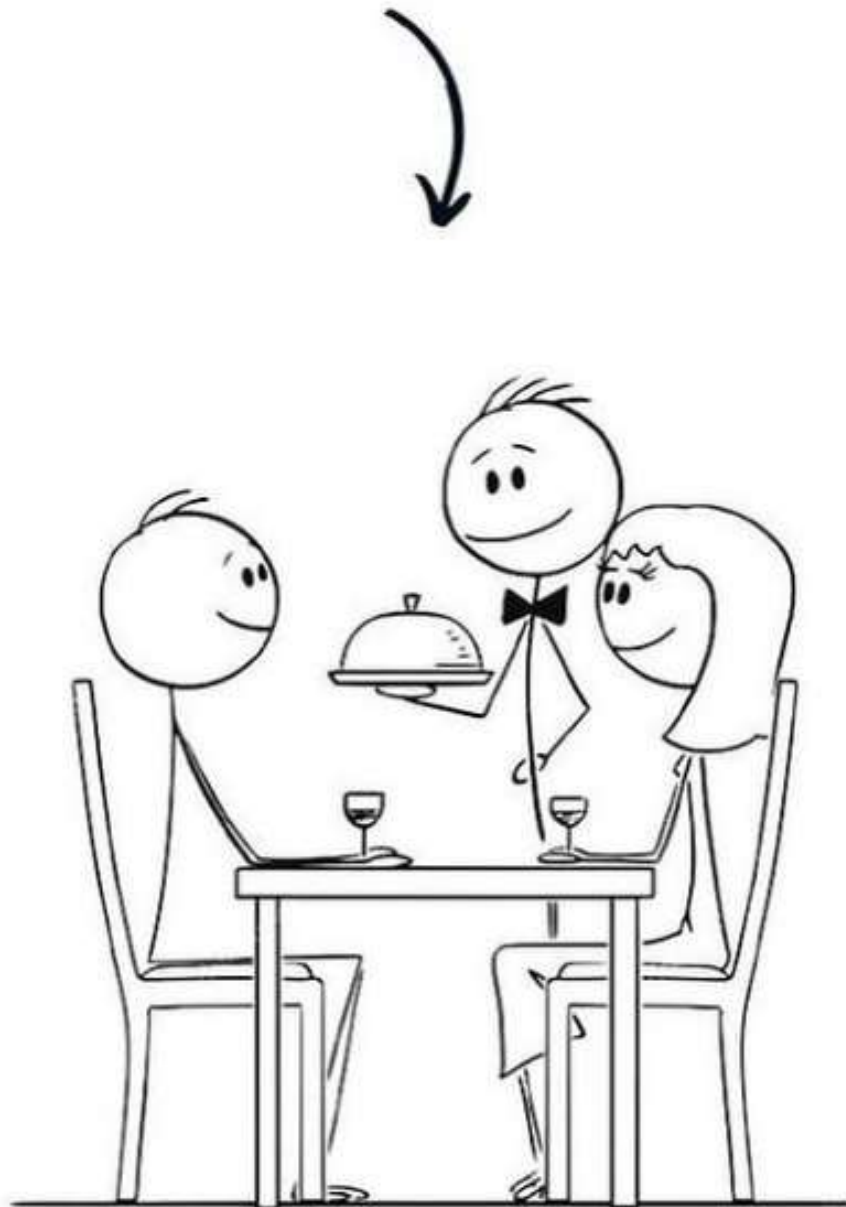

Art credit :
[@guzzsoares](#)

A waiter takes the order from the customer
which is then relayed to the chef.

Once the chef completes the meal
the waiter brings the meal to the customer.

Similarly,

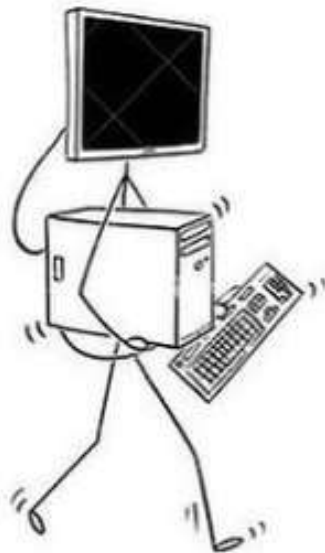

an API receives a request from an application.

It then interacts with a data source to collect and process a response,
which is then returned to the application.

Definition :

An API (Application Programming Interface) is a set of functions that allows applications to access data and interact with external software components, operating systems, or microservices.

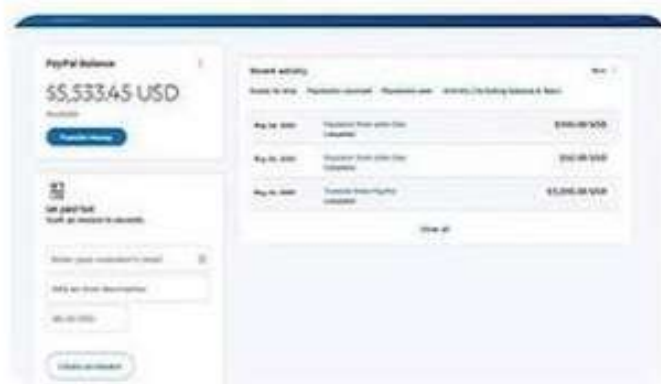

Few Popular API are :

Twitter

Paypal

Google Map

Mailchimp
